IMPLEMENT MINIMAX ALGORITHM

Pythoncode:

```
def minimax(depth, nodeIndex, isMax, scores, h):
```

```
    if depth == h:
```

```
        return scores[nodeIndex]
```

```
    if isMax:
```

```
        return max(
```

```
            minimax(depth + 1, nodeIndex * 2, False, scores, h),
```

```
            minimax(depth + 1, nodeIndex * 2 + 1, False, scores, h)
```

```
        )
```

```
    else:
```

```
        return min(
```

```
            minimax(depth + 1, nodeIndex * 2, True, scores, h),
```

```
            minimax(depth + 1, nodeIndex * 2 + 1, True, scores, h)
```

)

```
scores= [3, 5, 6, 9, 1, 2, 0, -1]
```

```
h = 3
```

```
print("Optimal value:", minimax(0, 0, True, scores, h))
```

Output:

Optimal value: 5

Result:

Thus the program of using the MINIMAX algorithm to evaluate the optimal move in a game tree was executed successfully.
